

## REMARKS

The foregoing Amendment and remarks which follow are responsive to the Office Action mailed October 15, 2002 in relation to the above-identified patent application. In that Office Action, the Examiner indicated that Applicant's prior Amendment filed July 10, 2002 did not comply with the requirements of 37 C.F.R. §1.121(c). As a result, the Examiner indicated that the claim modifications presented in Applicant's July 10, 2002 Amendment were not acknowledged or entered. Thus, in the latest Office Action, the Examiner repeated the rejection of Claims 1-20 under 35 U.S.C. §112 presented in the prior Office Action of January 24, 2002. The Examiner also repeated the rejection of Claims 1-4, 6-11, 13-18 and 20 under 35 U.S.C. § 103(a) as being unpatentable over the Glenn et al. reference (U.S. Patent No. 6,281,568) which was also originally presented in the January 24, 2002 Office Action.

As a preliminary matter, submitted herewith for the Examiner's consideration are duly executed Power of Attorney documents wherein the responsibility for the continued prosecution of the present application has been transferred to the undersigned. Accordingly, Applicant respectfully requests that all future correspondence rendered in relation to the present application be forwarded to the undersigned for handling.

By this Amendment, Applicant has further modified the specification of the present application in a manner believed to overcome the new matter objection advanced by the Examiner in the latest Office Action and to further clarify the language thereof. As is apparent from a review of Exhibits A and B attached hereto and a comparison thereof to the same exhibits previously filed on July 10, 2002, Applicant has now deleted from the specification the material added onto page 7, lines 29-30, page 7, lines 33-35, and page 9, lines 7-8 in the July 10, 2002

Amendment.

In addition to the foregoing, Applicant has made modifications to Claims 1, 2, 4, 8, 9, 11, 15, 16 and 18 which are identical to those originally presented in its July 10, 2002 Amendment, but are presented in the present Amendment in conformance with the provisions of 37 C.F.R. §1.121(c). In addition to these changes, minor changes have been made to Claims 4, 11, 15 and 18 to correct grammatical informalities therein. Applicant respectfully requests entry of these claim modifications, and respectfully submits that they effectively overcome the Section 112 rejection advanced by the Examiner in the latest Office Action.

In the prior January 24, 2002 Office Action, various objections were presented in relation to the originally submitted drawings. In Applicant's previously filed July 10, 2002 Amendment, amended drawings were presented to the Examiner for consideration and entry, the drawings having been modified in an effort to overcome the Examiner's objections under 37 C.F.R. §1.83(a) presented in the January 24, 2002 Office Action. Due to the absence of any indication in the latest Office Action that such drawings are still objectionable, it is Applicant's understanding that the amended drawings filed with the July 10, 2002 Amendment have been considered and entered by the Examiner, effectively overcoming the prior objection under 37 C.F.R. §1.83(a).

Referring now to the Section 103 rejection of Claims 1-4, 6-11, 13-18 and 20 presented in the latest Office Action, Applicant respectfully submits that such rejection is overcome for the same reasons argued by Applicant in its July 10, 2002 Amendment. More particularly, Applicant respectfully submits that pursuant to the provisions of 35 U.S.C. §103(c), the subject matter of U.S. Patent No. 6,281,568 (the cited Glenn et al. reference) and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of

assignment to the same person. The face of the '568 Patent designates one of the assignees as Amkor Technology, Inc. of Chandler, Arizona. Reel 011978, Frame 0833 at the Assignment Branch of the U.S. Patent and Trademark Office evidences the assignment of the present application to Amkor Technology, Inc. of Chandler, Arizona. Applicant respectfully submits that these circumstances compel a withdrawal of the cited Glenn et al. reference as a prior art reference under 35 U.S.C. §103(a), and hence the corresponding rejection of Claims 1-4, 6-11, 13-18 and 20.

On the basis of the foregoing, Applicant respectfully submits that the stated objections and grounds for rejection have been overcome, and that Claims 1-20 are now in condition for allowance. An early Notice of Allowance is therefore respectfully requested.

Attached hereto is a marked-up version of the changes made to the claims by the current Amendment. The attached page is captioned "Version with markings to show changes made".

If any additional fee is required, please charge Deposit Account Number 19-4330.

Respectfully submitted,

Date: 12/13/02

VERSION WITH MARKINGS TO SHOW CHANGES MADE

In the Claims:

Please amend the following claims:

1. (Amended) A packaged semiconductor, comprising:

a semiconductor chip having an upper surface, a ~~circumference~~ perimeter and a bottom surface;

a plurality of input bond pads and output bond pads on said upper surface along said ~~circumference~~ perimeter electrically connected to said semiconductor chip;

a leadframe having a chip paddle, said chip paddle having a top surface, a half-etched section, and a bottom surface, said chip paddle being bonded to said semiconductor chip by an adhesive, said leadframe having a plurality of tie bars, said plurality of tie bars being connected to said corners of said chip paddle, said plurality of tie bars externally extending from said chip paddle, said leadframe having a plurality of dam bars;

a plurality of leads connected to said leadframe;

a plurality of wires electrically connected to said plurality of leads and said semiconductor chip; and

encapsulation material encapsulating said semiconductor chip, said plurality of conductive wires, said chip paddle, and said plurality of internal leads to form a package body;

wherein said chip paddle has a plurality of through-holes in said half-etched

section of said chip paddle for increasing the bonding strength of said encapsulation material in said package body.

2. (Amended) The packaged semiconductor of claim 1, wherein said chip paddle has a ~~circumference~~ perimeter and said half-etched section is located at a lower edge of said chip paddle along said chip paddle ~~circumference~~ perimeter.

4. (Amended) The packaged semiconductor of claim 1, wherein each of said plurality of tie bars externally ~~extend~~ extends and has a half-etched section.

8. (Amended) A packaged semiconductor, comprising:

a semiconductor chip having an upper surface, a ~~circumference~~ perimeter and a bottom surface;

a plurality of input bond pads and output bond pads on said upper surface along said ~~circumference~~ perimeter electrically connected to said semiconductor chip;

a leadframe having a chip paddle, said chip paddle having a top surface, a half-etched section, and a bottom surface, said chip paddle being bonded to said semiconductor chip by an adhesive, said leadframe having a plurality of tie bars, said plurality of tie bars each having a side surface and a bottom surface, each of said plurality of tie bars being connected to said corners of said chip paddle, said plurality of tie bars externally extending from said chip paddle, said leadframe having a plurality of dam bars;

a plurality of leads connected to said leadframe;

a plurality of wires electrically connected to said plurality of leads and said

semiconductor chip; and

encapsulation material encapsulating said semiconductor chip, said plurality of conductive wires, said chip paddle, and said plurality of internal leads to form a package body;

wherein said chip paddle has a plurality of tabs in said half-etched section of said chip paddle for increasing the bonding strength of said encapsulation material in said package body.

9. (Amended) The packaged semiconductor of claim 8, wherein said chip paddle has a circumference perimeter and said half-etched section is located at a lower edge of said chip paddle along said chip paddle circumference perimeter.

11. (Amended) The packaged semiconductor of claim 8, wherein each of said plurality of tie bars externally ~~extend~~ extends and has a half-etched section.

15. (Amended) A packaged semiconductor, comprising:

a semiconductor chip having an upper surface, a circumference perimeter and a bottom surface;

a plurality of input bond pads and output bond pads on said upper surface along said circumference perimeter electrically connected to said semiconductor chip;

a leadframe having a chip paddle, said chip paddle having a top surface, a half-etched section, and a bottom surface, said chip paddle being bonded to said semiconductor chip by an adhesive, said leadframe having a plurality of tie bars, said plurality of tie bars each having a side surface and a bottom surface, each of said

plurality of tie bars being connected to said corners of said chip paddle, said plurality of tie bars externally extending from said chip paddle, said leadframe having a plurality of dam bars;

a plurality of leads connected to said leadframe;

a plurality of wires electrically connected to said plurality of leads and said semiconductor chip; and

encapsulation material encapsulating said semiconductor chip, said plurality of conductive wires, said chip paddle, and said plurality of internal leads to form a package body; and

~~wherein said chip paddle has a plurality of through-holes in said half-etched section of said chip paddle for increasing the bonding strength of said encapsulation material in said package body; and~~

wherein said chip paddle has a plurality of through-holes in said half-etched section of said chip paddle for increasing the bonding strength of said encapsulation material in said package body.

16. (Amended) The packaged semiconductor of claim 15, wherein said chip paddle has a ~~circumference~~ perimeter and said half-etched section is located at a lower edge of said chip paddle along said chip paddle ~~circumference~~ perimeter.

18. (Amended) The packaged semiconductor of claim 15, wherein each of said plurality of tie bars externally ~~extend~~ extends and has a half-etched section.

Case No.: AMKOR-045A

**EXHIBIT B**  
**MARKED-UP SPECIFICATION**

**SEMICONDUCTOR PACKAGE HAVING IMPROVED  
ADHESIVENESS AND GROUND BONDING**

~~TECHNICAL FIELD~~ SUNG SIK JANG

TECHNICAL FIELD OF THE INVENTION

[0001] The various embodiments of the present invention relates in general to a semiconductor package; and, more particularly but not by way of limitation, to a semiconductor package in which the adhesiveness between a chip paddle and a package body is improved, and the chip paddle ground-bonding is improved.

HISTORY OF RELATED ART

[0002] It is conventional in the electronic industry to encapsulate one or more semiconductor devices, such as integrated circuit dies, or chips, in a semiconductor package. These plastic packages protect a chip from environmental hazards, and provide a method of and apparatus for electrically and mechanically attaching the chip to an intended device. Recently, such semiconductor packages have included metal leadframes for supporting an integrated circuit chip which is bonded to a chip paddle region formed centrally therein. Bond wires which electrically connect pads on the integrated circuit chip to individual leads of the leadframe are then incorporated. A hard plastic encapsulating material, or encapsulant, which covers the bond wire, the integrated circuit chip and other components, forms the exterior of the package. A primary focus in this design is to provide the chip with adequate protection from the external environment in a reliable and effective manner.

[0003] As set forth above, the semiconductor package therein described incorporates a leadframe as the central supporting structure of such a package. A portion of the leadframe completely surrounded by the plastic encapsulant is internal to the package. Portions of the leadframe extend internally from the package and are then used to connect the package externally. More information relative to leadframe technology may be found in Chapter 8 of the book Micro Electronics Packaging Handbook, (1989), edited by R. Tummala and E. Rymaszewski and incorporated by reference herein. This book is

published by Van Nostrand Reinhold, 115 Fifth Avenue, New York, New York.

[0004] Once the integrated circuit chips have been produced and encapsulated in semiconductor packages described above, they may be used in a wide variety of electronic appliances. The variety of electronic devices utilizing semiconductor packages has grown dramatically in recent years. These devices include cellular phones, portable computers, etc. Each of these devices typically includes a motherboard on which a significant number of such semiconductor packages are secured to provide multiple electronic functions. ~~These electronic appliances are typically manufactured in reduced sizes and at reduced costs, consumer demand increases.~~ Accordingly, ~~not~~ Not only are semiconductor chips highly integrated, but also semiconductor packages are highly miniaturized with an increased level of package mounting density.

[0005] According to such miniaturization tendencies, semiconductor packages, which transmit electrical signals from semiconductor chips to motherboards and support the semiconductor chips on the motherboards, have been designed to have a small size. By way of example only, such semiconductor packages may have a size on the order of 1x1mm to 10x10 mm. Examples of such semiconductor packages are referred to as MLF (micro leadframe) type semiconductor packages and MLP (micro leadframe package) type semiconductor packages. Both MLF type semiconductor packages and MLP type semiconductor packages are generally manufactured in the same manner.

[0006] However, this conventional semiconductor package is problematic in that a thickness of the silver plated layer formed on the upper faces of the chip paddle and the internal leads deteriorates the adhesiveness between the package body and the chip paddle or the internal leads. That is, the silver-plated layer is very weakly bonded to the package body of the encapsulation material (the chip paddle or the side of the internal lead, both of which are made of copper, are strongly bonded to the package body), so that interfacial exfoliation is easily caused at the boundary between the package body and the silver-plated layer. Further, moisture can readily permeate the semiconductor package through the exfoliated portion, which may cause the semiconductor package to crack.

[0007] Usually a semiconductor chip or a chip paddle is ground-bonded by conductive wires to achieve grounding or eliminate electrical noise problems. In this conventional semiconductor package, the semiconductor chip is similar in area to the chip paddle, so that there are no sufficient areas for ground bonding.

### BRIEF SUMMARY OF THE INVENTION

[0008] In one embodiment of the present invention, there is provided a semiconductor chip having an upper surface and a bottom surface. A plurality of input bond pads and output bond pads on the upper surface of the semiconductor chip and along the circumference perimeter of the semiconductor chip are electrically connected to the semiconductor chip. A chip paddle is provided which has a top surface, a side surface and a bottom surface. The chip paddle is bonded to the bottom surface of the semiconductor chip by an adhesive. The chip paddle has corners, a circumference perimeter and a half-etched section at the lower edge of the chip paddle along the chip paddle circumference perimeter.

[0009] A leadframe is provided having a plurality of tie bars. Each of the tie bars has a side surface and a bottom surface. ~~The plurality of Each of the tie bars are~~ is connected to the corners of the chip paddle. ~~The plurality of tie bars and~~ externally extends from the chip paddle and ~~have~~ has a half-etched section. A plurality of dam bars ~~are~~ is provided on the leadframe to help limit flow of encapsulation material on the leadframe.

[0010] A plurality of internal leads connects to the leadframe. Each of the leads has a side surface and a bottom surface. The leads are radially formed at regular intervals along and spaced apart from the circumference perimeter to the chip paddle and extend towards the chip paddle. Each of the leads has a step shaped half-etched section facing the chip paddle.

[0011] A ground ring is provided having an upper surface and a lower surface, and positioned between the semiconductor chip and the plurality of internal leads. The ground ring may interchangeably be used as a ground or a power ring. The upper surface of the ground ring is substantially planar with the upper surface of the semiconductor chip and the upper surface of the plurality of internal leads. A plurality of ~~via~~ conductive wires ~~are~~ is electrically connected to the plurality of internal leads and the semiconductor chip, wherein the conductive wires have a loop height between the leads and the semiconductor chip. Because of the planarity of the grounding leads and ~~semi-conductor~~ semiconductor chip, the loop height of the conductive wires is minimized, which allows smaller packaging.

[0012] Encapsulating material encapsulates the semiconductor chip, conductive wires, chip paddle, and the leads to form a package body. The flow of the encapsulation material is limited by the dam bars formed on the leadframe. After encapsulation, the chip paddle, leads, and tie bars are externally exposed at respective side and bottom surfaces. The chip paddle further has through-holes in the half-etched section of the chip

paddle for increasing the bonding strength of the encapsulation material in the package body. In addition, tabs in the half-etched section of the chip paddle may be provided for the same purpose.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0013] A more complete understanding of the method and apparatus of the present invention may be obtained by reference to the following detailed description with like reference numerals referring to like elements when taken in conjunction with the accompanying Drawings wherein:

[0014] FIGURE 1 is a top plan view of one embodiment of the semiconductor chippackage of the present invention;

[0015] FIGURE 2 is a side elevation cross-section view of the semiconductor chippackage of FIGURE 1 taken along line 2-2;

[0016] FIGURE 3 is a side elevation cross-section view of the semiconductor chippackage of FIGURE 1 taken along line 3-3;

[0017] FIGURE 4 is a top plan view of a leadframe for one embodiment for the semiconductor package of the present invention;

[0018] FIGURE 5 is a top plan view of an alternate embodiment for the semiconductor package of the present invention; and

[0019] FIGURE 6 is a side elevation cross-section view of the semiconductor package of FIGURE 5 taken along line 6-6.

#### DETAILED DESCRIPTION OF THE INVENTION

[0020] Referring first to FIGS. 1 through 3, a semiconductor package 10 is shown construed in accordance with the principals of the present invention. ~~A~~ The semiconductor package 10 includes a semiconductor chip 20 having an upper surface 30, a ~~circumference~~perimeter 40 and a bottom surface 50. A plurality of input bond pads 60 and output bond pads 70 ~~are~~ is disposed on the upper surface 30 of the semiconductor chip 20. A chip paddle 80 having a top surface 90, a side surface 100 and a bottom surface 110 is secured to the bottom surface 50 of the semiconductor chip 20 via an adhesive 120. The chip paddle 80 has corners 130, a ~~circumference~~perimeter 140 (Fig. 4) and a half-etched section 150. The half-etched section 150 is located at a lower edge 160 of the chip paddle 80.

[0021] Referring now to FIGS. 1 through 4 in combination, a leadframe 170 is shown having a plurality of tie bars 180, a side surface 190 and a bottom surface 200. ~~(not shown).~~ The tie bars 180 are connected to the corners 130 of the chip paddle 80. The tie bars 180 externally extend from the chip paddle 80. The leadframe 170 further has a ~~half-etched section 210 and~~ a plurality of dam bars 220.

[0022] A plurality of leads 230 are connected to the leadframe 170 and have an upper surface 235 and a bottom surface 250. The leads 230 are radially formed at regular intervals along the ~~circumferenceperimeter~~ 140 and spaced apart from the ~~circumferenceperimeter~~ 140 of the chip paddle 80. The leads 230 extend towards the chip paddle 80, such that each of the plurality of leads 230 has a half-etched section 260 facing the chip paddle 80. It is to be noted that the hatched areas in FIG. 1 are the half-etched sections of the paddle 80 and leads 230.

[0023] Referring to FIG. 2, there is disclosed a ground ring 262 formed in the half-etched section 150 of the chip paddle 80. The ground ring 262 is positioned between the semiconductor chip 20 and the plurality of leads 230. The ground ring 262 may be interchangeably used as a power ring should circumstances require. The upper surface 264 of the ground ring 262 is planar with the upper surface of the ~~semiconductor chip 20~~ chip paddle 80 and the upper surface 236 of the leads 230.

[0024] A plurality of ~~via~~ conductor wires 270 ~~are~~ is provided and electrically connected to the plurality of leads 230 and the semiconductor chip 20. The plurality of conductive wires 270 have a loop height 275 between the plurality of leads 230 and the semiconductor chip 20. The loop height 275 of the conductive wires 270 is minimized from the upper surface 235 of the leads 230 and the upper surface 30 of the semiconductor chip 20.

[0025] To form the semiconductor package 10, encapsulation material 280 encapsulates the semiconductor chip 20, conductive wires 270, chip paddle 80, and leads 230. The dam bars 220 limit the flow of the encapsulation material 280 on the leadframe 170. During encapsulation, the chip paddle 80, leads 230, and tie bars 180 are externally exposed at the respective side and bottom surfaces. In ~~a first one~~ embodiment, the chip paddle 80 is provided with a plurality of through holes 300 in the half-etched section 150 for increasing the bonding strength of the encapsulation material 280 with the package 10.

[0026] The through holes 300 (Fig. 1) may be formed by chemical etching, such as when patterning the entire leadframe 170 for forming the half-etched section 150 of the chip paddle 80. Alternatively, the through holes 300 (Fig. 1) may be formed by the use

of a mechanical punch or similar device. It should be noted that other methods may be used to form the through holes 300, and the various embodiments of the present invention ~~is~~are not limited by the formation techniques disclosed herein.

[0027] Referring now to ~~FIGS. 4 and 5 in combination, FIG. 5,~~ an alternate embodiment for ~~the~~a semiconductor package ~~10~~11 is shown. In this embodiment, the chip paddle 80 is provided with a plurality of tabs 310 in the half-etched section 150 of the chip paddle 80 for the similar purpose of increased bonding strength. It is also contemplated that the combination of through holes 300 (Fig. 1) and tabs 310 may be used to increase the bonding strength of the encapsulation material 280 in the package 10.

[0028] The tabs 310 are formed in the half-etched section 150 of the chip paddle 80. The tabs 310 must ~~extended~~ to a limited degree to prevent a short circuit forming between the tabs 310 and the leads 230. It is preferable that the number of the tabs 310 corresponds to the number of the grounding input bond pads 60 and output bond pads 70 of the semiconductor chip 20. The tabs 310 may be formed by chemical etching when patterning the entire leadframe 170 and also by other mechanical methods depending on the requirements of the individual package ~~10~~11. By increasing the area or length of the chip paddle 80, the tabs 310 are easily bonded with conductive wires 270 by increasing the area for which to connect the conductive wires 270. The tabs 310 may serve to function as a ground or power ring 262 in certain applications. It is to be noted that the hatched areas in FIG. 5 are the half-etched sections of the paddle 80 and leads 230.

[0029] Referring now to FIG. 6, a cross-sectional view of the semiconductor package 11 taken along line 6-6 of FIG. 5 is shown. The tab 310 is electrically connected to the semiconductor chip 20 via conductive wire 270.

[0030] As described previously, the use of the through holes 300 and tabs 310 increases the bonding strength to the encapsulation material 280, in addition to improving the fluidity of the encapsulation material 280 upon encapsulating. The presence of the through holes 300 and tabs 310 improves the fluidity of encapsulation material 280 by directing flow over or through the tabs 310 and through holes 300 in the package 10. In certain embodiments, as shown in FIGS. 2 and 3, a plated layer 320 may be applied to the upper surfaces 90, 235 of the chip paddle 80 and leads 230, respectively, to increase bonding strength to the wires 270.

[0031] It is thus believed that the operation and construction of the present invention will be apparent from the foregoing description of the preferred exemplary embodiments. While the semiconductor package having improved adhesiveness and crown bonding

shown as described ~~as being~~ is preferred, it will be obvious to a person of ordinary skill in the art ~~to add that~~ various changes and modifications may be made therein without departing from the spirit and scope of the invention.

[0032] The previous description is of a preferred embodiment for implementing the invention, and the scope of the invention should not necessarily be limited by this description. The scope of the present invention is instead defined by the following claims.

[0033] The following applications are all being filed on the same date as the present application and all are incorporated by reference as if wholly rewritten entirely herein, including any additional matter incorporated by reference therein:

Attorney Docket No.	Title of Application	First Named Inventor
